

PRIMITIVES CANON

2026-03-18

Dexter Hadley, MD/PhD

Hadley Lab CANONIC

Abstract

INTEL, COIN, and TALK are the three native primitives of the GALAXY operating surface.

hadleylab.org Governed Research. Every claim cited.

Contents

Constraints

- MUST: INTEL pane renders scope intelligence (summary)
- MUST: INTEL pane is actionable (coverage gaps show)
- MUST: COIN bar shows wallet balance in control pane
- MUST: COIN bar supports transaction feed (mints, spends)
- MUST: COIN bar shows scope-level economy when viewed
- MUST: TALK interface replaces search dock at bottom
- MUST: TALK supports dual mode: search (default) and edit
- MUST: TALK carries current scope context in every message
- MUST: TALK streams responses via SSE in expandable list
- MUST: TALK recognizes governance commands (create, delete, update)
- MUST: All three primitives update contextually on ledger
- MUST: TALK responses that reference scopes are clickable
- MUST: INTEL coverage gap "fix" button opens TALK with prompt
- MUST: Every TALK edit operation logs to COIN ledger
- MUST: Every action attributed to authenticated Github user
- MUST NOT: Render primitives as separate pages (they co-exist)
- MUST NOT: Allow TALK editing without authenticated session
- MUST NOT: Bypass build pipeline for governance mutations

Primitive Composition

- | | |
|-------------------|--|
| Navigate to scope | INTEL updates (that scope's intelligence)
COIN updates (that scope's economy)
TALK context updates (that scope's context) |
| TALK edit command | Worker executes governed operation
COIN ledger records CONTRIBUTE event
Build pipeline triggers galaxy registration
Frontend hot-reloads with new scope |
| INTEL gap found | "Fix" button opens TALK with prompt
User describes fix in conversation
TALK creates governance artifact
Gap closes on next build |
