

LEARNING CANON

2026-03-18

Dexter Hadley, MD/PhD

Hadley Lab CANONIC

Abstract

LEARNING is INTEL applied. Every discovery governed. Every gradient evidenced.

hadleylab.org Governed Research. Every claim cited.

Contents

1 Constraints

1

INTEL is the primitive what you KNOW (= WORK). LEARNING is the service governed discovery extraction at scale. IDFs (Invention Disclosure Forms) are the archetype: structured records that capture what was discovered, when, by whom, with what evidence. LEARNING generalizes this pattern beyond patents to ALL governed scopes.

1. Constraints

MUST: Compose INTEL primitive every discovery evidence
 MUST: Follow governed record shape (generalized IDF)
 MUST: Source from governed operations only no fabrication
 MUST: Backpropagate gradients to upstream scopes
 MUST: Every scope has LEARNING.md the pattern table
 MUST: LEARNING.md pattern table: Date | Signal | Pattern
 MUST: Ingest LEDGER streams TALK, CONTRIBUTE, EMULATE
 MUST: Every ingested LEDGER entry becomes a LEARNING entry
 MUST NOT: Fabricate discoveries
 MUST NOT: Store unstructured data outside governed records
 MUST: GC frozen epochs after rotation, delete the rest
 MUST NOT: Bypass provenance chain every gradient trace
 MUST NOT: Ignore LEDGER streams silence is not governance
 MUST: Flat service layout no singleton stage directories
 MUST: CAS fanout git-style 2-char prefix buckets
 MUST: Manifest sharding one shard per signal type
 MUST: Incremental discovery checkpoint per repo, signal type
 MUST NOT: Store 100K+ entries in a single manifest file
 MUST NOT: Store 100K+ files in a single flat CAS directory
 MUST: Consume patterns build reads LEARNING.md back into ledger
 MUST: Surface regression signals repeated DEBIT:DISCOVERY
 MUST: Surface growth signals repeated MINT:WORK
 MUST: Feed INTEL consumed patterns wire into system
 MUST NOT: Capture without consumption write-only LEARNING
