

API CANON

2026-03-18

Dexter Hadley, MD/PhD

Hadley Lab CANONIC

Abstract

API is the network surface for COIN every endpoint authenticated, every response governed, vault commands wrapped not duplicated.

hadleylab.org Governed Research. Every claim cited.

Contents

- **API_IS_NETWORK_SURFACE** API is the network projection of COIN; all economic HTTP traffic routes through this service.
- **EVERY_ENDPOINT_AUTHENTICATED** endpoints authenticate via IDENTITY Bearer tokens; public views (SHOP, econ) serve without auth but carry governed schemas.
- **WRAPS_VAULT_COMMANDS** the API wraps vault commands and never duplicates economic logic; it validates request shape and returns JSON with governed schemas. ## Constraints

MUST: Authenticate via IDENTITY tokens (Bearer authentication)

MUST: Wrap vault commands never duplicate economic logic

MUST: Serve public views (SHOP, econ) without authentication

MUST: Validate request shape before dispatching to vault

MUST: Return JSON responses with governed schemas

MUST: Restrict CORS to governed origins never wildcard

MUST: Rate-limit all endpoints protect upstream providers

MUST: Retry Stripe and GitHub calls with exponential backoff

MUST: Handle SIGTERM drain in-flight requests before shutdown

MUST: Log all requests as structured JSON to stdout

MUST NOT: Expose VAULT internals (private balances, keys)

MUST NOT: Accept unsigned privileged actions (after rotation)

MUST NOT: Store state beyond CONFIG all truth lives in vault

MUST NOT: CORS origins governed: canonic.org, hadleylab.org
