

NOTIFIER CANON

2026-03-18

Dexter Hadley, MD/PhD

Hadley Lab CANONIC

Abstract

NOTIFIER is NOTIFY + INTEL composed scope determines the route, ledger determines the proof, delivery is inline and governed.

hadleylab.org Governed Research. Every claim cited.

Contents

- **INTEL_WIRED_INTO_DELIVERY** NOTIFIER never delivers without context; INTEL is wired into every notification.
- **SCOPE_DETERMINES_ROUTE** the `notify:` header in GOV maps directly to the delivery route at write time; routes are declared, not inferred.
- **LEDGER_IS_PROOF** every delivery is ledgered with sender scope, receiver scope, timestamp, and content hash; inbox per principal is governed and bounded.
- **INLINE_AT_WRITE** delivery is inline at ledger write; no polling, no delay, no queue. ## Constraints

MUST: Wire INTEL never deliver without context
 MUST: Scope determines the route `notify:` header in
 MUST: Every delivery ledgered sender scope, receiver
 MUST: Inline at ledger write no polling, no delay
 MUST: Inbox per principal governed, bounded, audited
 MUST: Cross-scope only NOTIFIER bridges identity
 MUST: GOV declares routes `notify:` field in CANON.1
 MUST NOT: Deliver without governed route (no ad-hoc message)
 MUST NOT: Poll direct mapping or nothing
 MUST NOT: Leak content across scope boundaries without
 MUST NOT: Fabricate delivery receipts
