

SURFACE CANON

2026-03-18

Dexter Hadley, MD/PhD

Hadley Lab CANONIC

Abstract

SURFACE is the platform lane GOV declares, runtime projects, MAGIC validates.

hadleylab.org Governed Research. Every claim cited.

Contents

- **SURFACE_IS_PLATFORM_LANE** SURFACE is the platform lane across which products project; every platform target is a projection of GOV.
- **DECLARE_PROJECT_VALIDATE** GOV declares the contract, the runtime projects the surface, and MAGIC validates the result; the three steps are ordered and non-fungible.
- **DETERMINISTIC_PIPELINE** build, sync, and deploy are deterministic and replay-safe so projections are reproducible. ## Constraints

MUST: Keep build/sync/deploy deterministic and reproducible

MUST: Treat GOV tree as the only source of truth

MUST: Keep runtime code minimal; enforce via governance

MUST: Separate concerns platform sells tiers, products

MUST: Leaf pages with layout: paper get inheriting

MUST: APP surface_type Next.js App Router, reads manifest

MUST: GALAXY surface_type chrome-free operating system

MUST: APP scopes compile CANON.md CANON.json (same as GOV)

MUST: APP scopes wire COIN + INTEL + TALK primitives

MUST NOT: Declare 'surface_type: JEKYLL_*' in any GOV contract

MUST NOT: Hardcode fleet membership, surfaces, or identifiers

MUST NOT: Embed proof-site URLs in platform-site content
