

INIT CANON

2026-03-18

Dexter Hadley, MD/PhD

Hadley Lab CANONIC

Abstract

INIT is governed scope bootstrap every new scope enters the world the same way, through validated phases, until MAGIC 255.

hadleylab.org Governed Research. Every claim cited.

Contents

- **INIT_IS_GOVERNED** initialization is a governed process; scopes are never hand-created, and the INIT contract is the only entry point.
- **BOOTSTRAP_THROUGH_PHASES** a scope is not born partial; it bootstraps through phases, each phase validated, until it reaches MAGIC 255.
- **TRIAD_IS_FIRST** scaffolding starts with the TRIAD (CANON.md + VOCAB.md + README.md) at COMMUNITY tier before anything else, and no inherits path is left unresolved. ## Constraints

MUST: Scaffold TRIAD first (CANON.md + VOCAB.md + README.md)

MUST: Resolve inherits path before generating COVERAGES

MUST: Promote through tiers in order (COMMUNITY < BETA < ALPHA)

MUST: Validate 255 before merge no partial scopes

MUST: Generate scope slug from directory name (SCREENSHOT)

MUST: INIT is idempotent running twice produces the same result

MUST NOT: Hand-create partial scopes use the INIT pipeline

MUST NOT: Skip TRIAD every scope needs CANON + VOCAB + README

MUST NOT: Create scopes with broken inherits paths

MUST: Parent scope must exist before a child claims coverage
