

VOCAB CANON

2026-03-18

Dexter Hadley, MD/PhD

Hadley Lab CANONIC

Abstract

VOCAB normalizes the lexicon one term, one definition, at the highest scope; children inherit, not duplicate.

hadleylab.org Governed Research. Every claim cited.

Contents

- **ONE_TERM_ONE_DEFINITION** each governed term has exactly one definition at the highest scope that needs it.
- **CHILDREN_INHERIT** children inherit terms from parents and never duplicate them; duplication is a hygiene violation.
- **VOCAB_IS_SERVICE** VOCAB is a TOOLCHAIN service whose function is NORMALIZE; the primitive is INTEL (what the system knows about its own terms). ## Constraints

MUST: Single canonical definition per term at high

MUST: All terms SCREAMING_CASE

MUST: No empty definitions (| TERM | |)

MUST: inherits: header resolves to a valid parent

MUST: Child VOCAB.md adds only scope-specific terms

MUST: validate-vocab runs in build pipeline hard

MUST NOT: Duplicate a parent term with identical definition

MUST NOT: Redefine a parent term with conflicting definition

MUST: VOCAB redundant entries extinct: child scopes must

MUST: New constraint: MUST: Every service scope carry

MUST: ABPMABOPM sweep across SERVICES/ANKI/* (CANON, C

VOCAB / CANON / TOOLCHAIN
